Beat the Fall Rush - Schedule Your Boiler/Burner Clean & Check

Fall is just around the corner - Bringing with it, cooler temperatures. Be sure your boiler and burner is ready to run as efficiently as possible, especially with the continued threat of rising energy prices.

A clean and check will ensure that the fire tubes are clear from soot and scale built up. Soot build-up inside the boiler tubes lead to maintenance problems, along with scale on the waterside, resulting in reduced efficiency.

Something to think about... Tests conducted by municipalities, heating plant engineers and boiler manufacturers have proven that even a small amount of hard scale on the water side (1/16") will reduce heat absorption by as much as 12% and increase fuel costs by 9% percent. Hard scale (1/4") reduces heat absorption 32% and increases fuel costs 24%!

What to do... The boiler fireside requires brushing out all the fire tubes, vacuum cleaning the entire boiler, breeching, fire chamber and chimney base. Flush out any loose mud and scale from the water-side while inspecting for "hard packed" scale. Repair any boiler leaks and replace gaskets annually. It's time to get this summer work completed

NOW... while the heating boiler is shut down. The correct way to service your burner is to partially disassemble it for cleaning and inspection of its internals. Replacing worn linkage parts is routine for our service techs. Heat damaged firing heads can be a real fuel waster too, costing you money because of poor fuel/air mixing....and you won't know why?

Getting these repairs completed before the first "cold snap" will save you headaches and some misery later. Call 773-737-9200 to get this scheduled today.

Did you Get Your Complimentary White Paper

"Gaining Efficiencies with a Boiler OR Burner Replacement"

White Paper:

Gaining Efficiencies with a Boiler OR Burner Replacement

Serving Chicago Since 1964

Visit
