## With the Fluctuating Cost of Energy, Your Burner May Have the Answer

The more we hear in the news about energy, the more the story changes. It's amazing just a couple months back we were paying over \$4 for a gallon of gas and now we're paying just over \$2. By the time you read this article it could be a penny or \$10 per gallon.

If there's one thing we can count on is that energy prices will continue to fluctuate, and more than likely, will certainly rise. Since turning off the burner/boiler system is out of the question, finding ways to conserve energy is the only way to save money.

If you have regular maintenance done on your boiler and you know that it's in good working order, let's consider the burner. If you find that your burner is cycling on and off excessively, there's an excellent chance savings can be made.

To help identify the amount of savings, one of the more reliable ways is through the ACSI Energy Savings Analysis. By conducting the analysis, you'll be able to identify the weak areas of the burner and how efficient or inefficient the burner is working.

If you can save 1% energy, what would that cost savings be?

If you can save 3% energy, what would that cost savings be?

Just image if you were in the 6 – 10% cost savings range.

We've reached these higher percentages for other customers. ***Why not you?***
